Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                          The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, athma, tumour cell nisorders, pulmonary fibrosis, asthma, tumour cell ingogenesis, tumour cell metastasis, glaucoma, contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present casculate (uPA) single chain urokinase (scuPA) deletion mutant designated as scuPA deltal36-143.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2ymogen AAP50871 is the inactive precursor form of human urokinase. Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular wt.of 20,000) and L (molecular wt.of 20,000) chains when traered with catalytic amounts of plasmin. The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It is a thrombolytic agent which manifests its plasminogen activator activity on cleavage by proteolytic enzymes of urokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Urckinase precursor-lipid composite - used as thrombolytic agent, having prolonged half-life in the blood, enhanced bio:availability and improved activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       By forming a precursor-lipid composite, the half-life of this thrombolytic agent in the blood may be increaced, exhibiting improved activity without abnormal acceleration of fibrinolytic activity. Compound is useful as a thrombolytic agent in treatment of cerebral thrombosis, myocardial infarction etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  99.4%; Score 2243; DB 11; Length 411; 98.1%; Pred. The present sequence shows the wild-type urokinase plasminogen activator (UPA). Cyclic peptides based on the amino acids residues 20-30 (the receptor-binding region) of UPA are claimed. These cyclic peptides target the UPA receptor (UPAR), allowing therapeutic or diagnostic agents to be delivered to UPAR-expressing cells. The cyclic peptides are used, optionally when linked to a therapeutic agent, to inhibit migration, invasion and proliferation of cells, or angiogenesis, or to induce apoptosis. Particularly they are used, in human or veterinary medicine, or therat diseases characterized by these processes, e.g. solid tumors, contract diseases characterized by these processes, e.g. solid tumors, cleukaemia or lymphoma (or their metastases); benigh hyperplasis; atherosclerosis, restenosis; ischaemia; deep vein thrombosis; neovascular callacosis; ischaemia; deep vein thrombosis; neovascular callacosis; ischaemia; deep vein thrombosis; neovascular callacosis; pretrioristis; fibrosis; bone fracture etc., most particularly growth, invasion and metastasis of tumors. When cyclic peptides can be used for diagnostic detection of uPAR when immobilized they are used to isolate uPAR or cells that express them. The cyclic peptides are stable, soluble in water, bind strongly to uPAR, are relatively inexpensive to produce and may be derivatized by attachment of therapeutic or diagnostic agents without significantly affecting their binding. Since they target uPAR, they should have the relatively low systemic toxicity and only low doses are required.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ۲,

The urokinase is used treat thrombosis and embolic diseases as well as in the treatment diseases in combination with anticancer agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, disorder, male impotence, respiratory discress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence as the condition contraction disorder thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (UPA) two
                                                                                                                                                          Human, urokinase-type plasminogen activator; uPA; therapy; hypertension; stroke; hypotension; atherosclerosis; heart atteak; thrombotic disorder; microvascular occlusion; angiogenic disorder; pulmonary fibrosis; asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease; male impotence; adult respiratory distress syndrome; touPA; scuPA; two chain urokinase; aingle chain urokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

The patent is for the prodn. of human single chain urokinase-type plasminogen activator (UTPA). Mutants of scu-PA are especially those which render the protein protease resistant. Such scu-PA mutants are covalently modified at sites of proteolysis by proteases occuring in blood such as thrombin or plasmin, so that thay are no longer susceptable to protease hydrolysis at these locations. The target sites include Lysils to Lysils (cleavage at this site generates the so-called low molecular weight form of scu-PA or LUK), Argiss to Phel57 (susceptible to thrombin attack) and Lysils to liel59 (cleavage at this site by plasmin generates tuc-PA). Suitable scu-PA mutants have site site by plasmin generates tuc-PA). Suitable scu-PA mutants have site specific substitutions, insertions or deletions of residues at come or more of these target sites. Especially preferred are those mutants in which one amino acid residues forming the target sites are deleted or in which at least one of these mutants are resistant to proteolytic attack. The UTPA proteins exhibit the biological activity of natural human UTPA without the refolding procedure being necessary. They can be used as for known PAs in humans for the prevention or treatment of thrombosis or other contains the protein or treatment of thrombosis or other contains the proteins who was a for known pass in humans for the prevention or treatment of thrombosis or other contains the proteins while the proteins or other contains the proteins or other proteins the proteins or other contains the proteins or other contains the proteins or other contains the proteins the proteins or other contains the proteins the proteins or other proteins the proteins t

Possible error in the specification. Should read CGA? The pro-UK gene was derived from plasmid pUK13. The CDNA was The pro-UK gene was derived from plasmid pUK13. The CDNA was synthesised using urokinase mRNA isolated from a human kidney cell line. Pro-UK was cloned into a SV40 promoter-contg. plasmid down-stream of the promoter. This plasmid was then ligated to a DHFR-gene contg. plasmid so that pro-UK and DHFR are inserted in opposite directions. The recombinant plasmid was used to transform CHO-K1 cell derived DHFR gene-deficient host cells to produce (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                     of recombinant protein, esp. human pro:urokinase - from transgenic animals using promoter of bovine alpha Sl casein
                                                                                                                                                                                                                              E.coli strain C6008F8 was transformed with recombinant plasmid containing ds DNA derived from human pharynx cancer cell strain Detroit 562. 10000 colonies were screened and one positive clone was identified. Plasmid pUKI was isolated and found to contain the coding region and 3' non-coding region of pro-UK downstream of Cys(11). Four silent substitutions were identified c.f. Holmes et al., Biotechnology, vol.3, p.923 (1985) as follows: (sic) Asn(254), AAC to AAT; Leu(340), CTA to CTG; Pro(345), CCC to CCA, GJN(346), CAA to CAG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences (AAQ55771-72) are pro-urokinase derivatives. The products have an inserted sugar moeity having an amino acid substituted, depleted or inserted variant around the thrombin cleavage site. They also have a long half-life allowing them to be used in the treatment of thrombosis.
                                                                                                       Pro-urokinase; half-life; thrombolytic; thrombosis; fibrinolytic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       403

This CDNA was used in the construction of a plasmid capable of transforming either yeast or vertebrate cells, enabling them to produce the 54000 dalton human UK protein. The UK glycoprotein produced could then be used in the treatment of cardiovascular diseases, including pulmonary embolism. The UK produced using this method had the advantage of a specific activity towards fibrin and extant thrombi, not demonstrated previously with UK isolated from natural sources. ```
The present sequence is human plasminogen activator urokinase (u-PA), a serine protease which hydrolyses a peptide bond in human plasminogen to convert it to its active form, plasmin. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Plasmin is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen activators regulate plasminogen expression either by hydrolysing a activators ragulate plasminogen expression either by hydrolysing a complexes with plasminogen to spontaneously convert it to plasmin, Review of sequence homologies of several plasminogen activators and chymotrypsin has identified a six amino acid peptide involved in plasminogen
                                                                                                                                                                                                                                                                     320

This invention describes a novel thrombolytic agent comprising streptokinase where at least one nonessential portion has been modified. The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the monessential portions removed or truncated simplify the molecule. Such smaller proteins are cheaper and easier to produce. This sequence represents a fragment of the human urokinase protein which is used in the description of the method of the invention.

activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.

                                                                                                                                                                                                                                                     Peptide
                                                                                                                                                                                                                                                                              Protein
                                                                                                            sc-uPA
                                            The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent, i.e. a protease. The inhibitor agent inhibits the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PGF), inconsective dissue derived growth factor (FGF), connective tissue derived growth factor (GGF), connective dissue derived growth factor (KGF), transforming growth factor (GGF), consection of protein agrowth factor (KGF), transforming growth factor (GGF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence represents a human uPA, and is used to produce the composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RGGSVTYVCGGSLISPCWVISATHCFIDYPKKEDYIVYLGRSRLMSNTQGEMKFEVENLI 260

This sequence represents single chain prepro-urckinase (sc-upA).

Pro-urckinase (amino acids 21-431) with a cleavage between amino acids 178 and 179 gives high molecular weight urckinase-type classinogen activator (HWW-upA). HWW-upA is a protein consisting of two peptide chains linked by a di-sulphide bond. The chains, close and 179 of pro-urckinase. HWW-upA is obtain acids in a kringle domain and a urckinase receptor (CDB) binding domain. HWW-upA is then cleaved between amino acids 155-178 and 179-60 plasminogen activator (LWM-upA) at then cleaved between amino acids 155-178 and 179-411, that has no plasminogen activator activity. Sc-upA, or fragments of it, may be used in the anti-HIV agents of the invention which comprise a ligand molecule that binds to CDB7. The agents are useful for treating HIV-infected humans for suppression of reproduction of HIV. The anti-HIV agents act by a mechanism of action different from those of conventional drugs, widening the choice of therapeutics agents and avoiding problems of
                                                                                                                                                                                                                                                                                                                              Single chain prepro-urokinase; sc-uPA; pro-urokinase; HIV; high molecular weight urokinase-type plasminogen activator; HWW-uPA; long A; long B; ESF-like domain; kringle domain; urokinase receptor; low molecular weight urokinase-type plasminogen activator; LMW-uPA; CD87; binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     'note= "With a cleavage between amino acids 178-179"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "With a cleavage between amino acids 178-179"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti-HIV agents, comprises ligand molecule that binds to CD87, e.g. high molecular weight urokinase-type plasminogen activator, amino-terminal fragment or an anti-CD87 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21..431

in the specification, where each isogene comprises the regions of the PLAU gene or CDNA and is further defined by the corresponding sequence of polymorphisms (Gefining single nucleotide polymorphisms, SNP). Also included are methods of haplotyping/genotyping (and predicting the abjotype/genotype of the PLAU gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLAU gene, an isolated oligonucleotide for detecting a complexity of the PLAU gene, a recombinant non-human organism transformed or transfected with the gene or CDNA, fragments of the polymorphic variant PLAU protein or fragment of sie, an isolated polymorphic variant PLAU protein or fragment for sie, an isolated polymorphic variant PLAU a computer system for storated and analysing polymorphism data for the PLAU a computer system for cancers. The malysing polymorphism data for the PLAU gene and a genome cancers. The methods are useful for improving the efficiency and diseases associated with PLAU activity, in validating PLAU as a drug diseases as sociated with PLAU activity, in validating PLAU as a drug condition of disease associated with PLAU activity. The antibody is useful in diagnostic, prognostic and therapeutic methods. PLAU or candidate or useful in studying the expression and function of PLAU, and in expressing PLAU protein for use in screening for candidate drugs to treat diseases related to pLAU activity. The gene for PLAU is a plant of the discovery and eventual protein for use in screening for candidate or an interpretation for use in screening for pLAU in an interpretation of the pLAU protein for use in screening for PLAU in an interpretation of the pLAU protein for use in screening for PLAU in an interpretation of the pLAU protein for use in screening for PLAU in an interpretation of the pLAU protein for use in screening for PLAU in an interpretation of the pLAU protein for use in screening for PLAU in an expressing pLAU protein for use useful in the pLAU protein for the pLAU a

                                                The invention relates to a method of identifying a compound for treating cancer. The method involves detecting the expression of a panel of sequences selected from transcription factor Etel, urokinase-type plasminogen activator (uPA), Nacetylglucosaminyltransferase V (GnT-V), matrix-type metalloproteinase (MMP)-1 and MMP-3 in the cell. The method cancer cell or identifying a compound that affects a cell, particularly a cancer cell or identifying a compound that affects a cell, particularly a Li s used for diagnosing and/or treating cancer or other conditions that are affected by one or more members of a panel of genes or that protein product. The method is also useful for drug discovery, drug safety evaluations and in gene therapy. The present sequence is human uPA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         172

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising concacting a biological cample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits concer-associated expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for cancer-associated polynucleotides and polypeptides are used for concer-associated proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having coll to treat lung cancer in a patient and for treating a mammal having coll to treat lung cancer by administrating a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer or other benign or precancerous cancer, non-small cell lung cancer or other benign or precancerous cultations, e.g. atelectasis, emphysema, bronchtis, chronic obstructive pulmonary disease, fibrosis, apphysema, bronchtis, interstitial cultang pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides conditions are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABUS6745 represent lung cancer, such as an colypeptides of the invention.
                                                                                                                                                                                                                                                                                                      Lung cancer-associated polypeptide; cytostatic; emphysema; antiinflammatory; antiaethmatic; non-small cell lung cancer; atelectasis small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological casmple from the patient with a polymicleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits concreased or decreased expression in lung cancer samples. Lung cancer-associated polymoleotides and polymeptides are used for identifying a compound that modulates a lung cancer-associated for inhibiting proliferation of a lung cancer-associated coll to treat lung cancer in a patient and for treating a mammal having cancer hy administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer or other benign or precancerous cancer, non-small cell lung cancer or other benign or precancerous concern, at electasis, emphysem, bronchitis, chronic obstructive pulmonary fibrosis, asthma and bronchites. The genes, polymicleotides cond polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibuted as a published that modulate lung cancer, such as antibuted as a published that modulate lung cancer, such as a polymored as the second and promotive and polymerated and as targets for antibodies. Sequences ABUS6745 represent lung cancer sesociated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The protein has fibrinolytic activity and can be used in the same way as PUK, e.g. for treating acute myocardial infarction, lung membolism and deep venous thrombosis. It has greater affinity for plasminogen bound to fibrin than for circularing plasminogen, so have high selectivity for thrombi with reduced chance of bleeding. Compared with the COM+terminated cpds., it has a better stability against most carboxypeptidases and prolonged half life. See also AAQC0360, AAQC0364-58 and AARC0336-38.                                                                                                                                                                                                                                                                                                                                       A new compound, which is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding urokinase plasminogen activator, specifically hybridises with and inhibits the expression of urokinase plasminogen activator. The compound is useful for preparing a composition for treating (e.g. by gene therapy) hyperproliferative disorder, cancer e.g., breast, colon, bone, brain, ovary, cervix, endometrium, scomach or kidney cancer, or tumour metastasis. This is the amino acid sequence of a urokinase plasminogen activator.

It has greater affinity for plasminogen bound to fibrin than for circulating plasminogen. So have high selectivity for thrombi with reduced chance of bleeding. Compared with the COOM-terminated cpds., it has a better stability against most carboxypeptidases and prolonged half life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The protein has fibrinolytic activity and can be used in the same way as PUK, e.g. for treating acute myocardial infarction, lung embolism and deep venous thrombosis. It has greater affinity for plasminogen bound to fibrin than for circulating plasminogen, so have high selectivity for thrombi with reduced chance of bleeding. Compared with the COOH-terminated cpds., it has a better stability against most carboxypeptidases and AR20556.38.

This sequence represents the full length urokinase, including the whey acid protein (WAP) signal peptide. This sequence has residues 179-184 of the urokinase sequence deleted to create the modified urokinase (see AAW24579) cleaves plasminogen, and has a lower binding affinity for plasminogen activator inhibitor-1 than the corresponding unmodified urokinase. (Urokinase is one of two types of mammalian plasminogen activators (PA), the other being tissue type PA. PAS catalyse the conversion of the circulating zymogen plasminogen to the broad spectrum protease plasmin by infinited proteolysis. The modified urokinase and be used for old lysis, specifically to dissolve heart attack-causing clots before they cause permanent damage to heart muscle. The urokinase mutant is more resistant to inhibition by plasminogen activator inhibitors than the unmodified urokinase. It can be selectively expressed and secreted from the mammary glands of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               139

Patent No. 5976841
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: WIENDEL-WIELAND, Regina
APPLICANT: STEFFENS, Gerd Josef
ATTLE OF INVENTION: Proteins having Fibrinolytic and
TITLE OF INVENTION: Coagulation-inhibiting Properties
NUMBER OF SEQUENCES: 60
CORRESPONDENCE ADDRESS:
ADDRESSEE: Evenson, MCKeown, Edwards & Lenahan
STREET: 1200 G Street, N.W., Suite 700
CITY:
COMMANDER OF SEQUENCES OF STREET: 200 G Street, N.W., Suite 700
COTY:
CO
                                                                                                                                     Indels
